CC Synthetic Affinity Reagents) peptides. This generate random TSAR (Totally
CC Synthetic Affinity Reagents) peptides. This generate formula can also be
CC represented as follows: X(NNB)1(TGC)(NNB)10(TGC)2(NNB)4Z(NNB)8(TGC)(NNB)
CC +9Y. X and Y are flanking restriction sites (X is not the same as Y)
CC that are not specific peptides generated by these generic sequences
CC 070466-68. Other specific peptides generated by these generic sequences
CC are shown in R65151-54. TSARs are concatenated heterofunctional proteins
CC domain with affinity for a ligand and a second effector peptide portion
CC that is chemically or biologically active. They may further comprise a
CC linker peptide between the 2 domains. The oligonucleotides are also
CC designed so that the expressed peptide contains 2 or 4 cysteine residues
CC positioned in, or flanking, the unpredicted or variant residues. These
CC residues confer some degree of conformational rigidity to the peptides.
CC vivo to deliver a chemically or biologically active moiety, eg. metal
CC on the cell. They can also replace the function of macromolecules, eg.
CC monoclonal or polylonal antibodies and therefore circunvent the need for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                  This sequence represents a human or mammalian DNA replication origin consensus sequences of the invention, designated uniorsconsensus. Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication in vivo or in vitro. The consensus sequences can also be inserted into an expression vector, used subsequently for in vitro transfection of mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of
                                                                                                                                                                                                                                                                                                                                                                                         W09827200-A2.

Particularly, they are used to create shuttle vector constructs for defining the essential mammalian elements required for maintenance of chromosomal function. The consensus sequence can be combined with cloned human telomeres and large centromeric blocks for assembly of human artificial chromosomes and maintained as bacterial plasmids, circular or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Administration of the consensus sequence or an anti-gene (comprising a double stranded copy of the consensus) is used to inhibit DNA replication in vivo or in vitro. The consensus sequences can also be inserted into an expression vector, used subsequently for in vitro transfection of mammalian cells, to control initiation of DNA replication. They can also be used used to maintain circular plasmids that are capable of
               semi-conservative replication in proliferating mammalian cells, or inserted into mammalian or human artificial chromosome vectors for gene therapy. Particularly, they are used to create shuttle vector constructs therapy the essential mammalian elements required for maintenance of the constructs are the constructs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    06-OCT-1998 (first entry)

Statistics: Mean 73.220; Variance 175.053; scale 0.418

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CATALTYIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALANINE ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE.

PATHWAY: PEPTIDOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

SIMILARITY: BELONGS TO THE MURCDEF FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    European

CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALANINE
ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE.

PATHWAY: PEPTILOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

SIMILARITY: BELONGS TO THE MURCDEF FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                 V D D Y G H H P T E V D A T I K A A R A TOGINGAYGAYTAYGGNCAYCAYCCNACNGARGTNGAYGCNACNATHAARGCNGCNMGNG 1102

CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALI
ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE
PATHWAY: PEPTIDOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SIMILARITY: BELONGS TO THE MURCDEF FAMILY.

CATALYTIC ACTIVITY: ATP + UDP-N-ACETYLMURAMOYL + L-ALANINE
ADP + ORTHOPHOSPHATE + UDP-N-ACETYLMURAMOYL-L-ALANINE.

PATHWAY: PEPPTIDOGLYCAN BIOSYNTHESIS.

SUBCELLULAR LOCATION: CYTOPLASMIC (PROBABLE).

SIMILARITY: BELONGS TO THE MURCDEF FAMILY.
